Chapter 0

Preliminaries

0.2 Quantifiers and Negation

Exercise 0.2.1 Negate the following statements:

- a. Every prime number such that if you divide it by 4 you have a remainder of 1 is the sum of two squares.
- b. For all $x \in \mathbb{R}$ and for all $\epsilon > 0$, there exists $\delta > 0$ such that for all $y \in \mathbb{R}$, if $|y - x| < \delta$, then $|y^2 - x^2| < \epsilon$.
- c. For all $\epsilon > 0$, there exists $\delta > 0$ such that for all $x, y \in \mathbb{R}$, if $|y - x| < \delta$, then $|y^2 - x^2| < \epsilon$.

SOLUTION a. There exists a prime number in the form of $4n + 1$, for $n \in \mathbb{N}_0$ that cannot be expressed as the sum of two squares.

- b. There exists $x \in \mathbb{R}$ and $\epsilon > 0$ such that for all $\delta > 0$, there exists $y \in \mathbb{R}$ with $|y - x| < \delta$ but $|y^2 - x^2| \geq \epsilon$.
- c. There exists $\epsilon > 0$ such that for all $\delta > 0$, there exists $x, y \in \mathbb{R}$ with $|y - x| < \delta$ but $|y^2 - x^2| \geq \epsilon$.

0.3 Set Theory
